Water Quality Management and Assessment

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

BY

DR.SHAMILA BINTI AZMAN
shamila@utm.my

SYNOPSIS

This course is designed to expose students to current trends and various aspects of water quality assessment and management for river catchments, lakes, reservoirs, wetlands, and marine ecosystems.

It tackles problems involving water pollution and its impacts on the environment and legislation. Water quality monitoring projects carried out by students will enable the application of proper sampling and monitoring methods.

At the end of the course, students will then be able to assess water quality problems and plan mitigation and control measures for water pollution.

Water Quality Management

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

Water Quality Management

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

WATER QUALITY ASSESSMENT

evaluation of the physical, chemical, and biological nature of water in relation to the natural quality, human effects, and intended uses which may affect human health and the health of the aquatic environment

Water Quality Management

WATER QUALITY MONITORING

the collection of information at set locations and at regular intervals in order to provide data that may be used to define current conditions, establish trends, etc

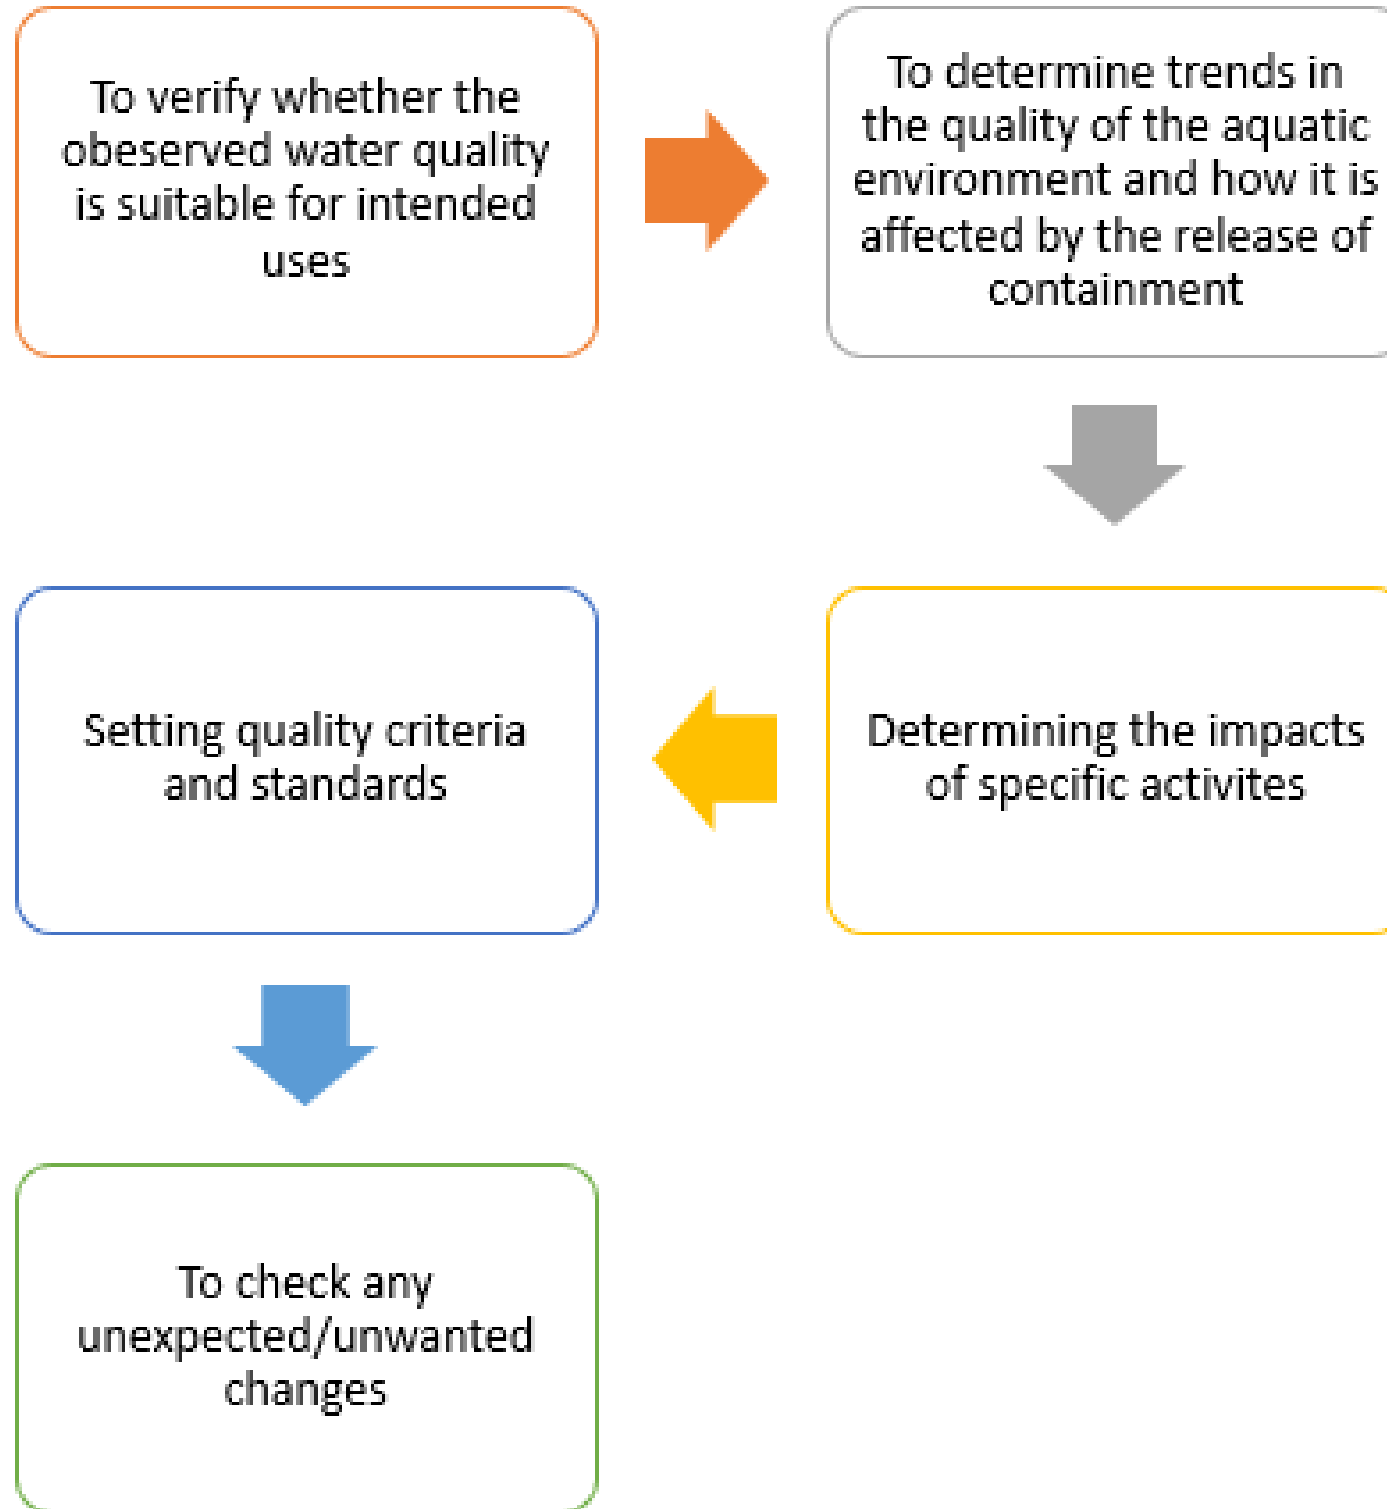

Water Quality Assessment

MALAYSIA WATER RESOURCES

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

- Malaysia Avg Rainfall 2,940 mm
 - Peninsular = 2495.5 mm
 - Sabah = 2560 mm
 - Sarawak = 3640 mm
 - Labuan = 3100 mm

Area	No.	Main River Basin (>80km ²)
Peninsular	1,235	74
Sabah	1,468	75
Sarawak	283	40
Total	2,986	189 (95% landuse)

WORLD'S RIVER CONDITION

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

CLIMATE CHANGE

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

Climate Change

93% is related to water

Effects of climate change on Malaysia

Peninsula Malaysia to see a 0.6°C to 0.9°C in temperature hike by 2030 and a 1.2°C to 1.6°C hike by 2050

Sabah to see temperature rise of between 0.8°C to 1.0°C in 2030 to 1.3°C to 1.4°C in 2050.

Sarawak to see temperature rise of between 0.6°C to 0.8°C in 2030 and 1.3°C to 1.6°C in 2050.

Average annual rainfall to go up by between 1% to 6% in 2030 and by 7% to 11% by 2050.

Sea level will rise by between 30mm to 210mm in 2030 and between 110mm to 620mm by 2050

Dry spells due to El Nino may see water storage levels fall below 50% and 106 water deficit months in rice planting areas.

Public health facilities near coastal areas in Langkawi, Klang, Lumut, Batu Pahat, Kuantan and Pekan may be impacted by sea level rise.

81% increase in the number of oil palm areas - currently planted in 15 flood prone river basins - to be affected by floods by 2030. By 2050, there will be 460% increase.

Rice fields in Kedah, Kelantan and Selangor to see yield reduced by 6% in 2030 and 31% by 2050; 20% of fields in Kelantan and 10% of fields in Kedah to face flood risk. Fields along the coastal low lying plains in Kedah may be affected by sea level rise.

INTERGRATED WATER RESOURCES MANAGEMENT (IWRM)

THE NEED OF IRBM

IRBM DEFINED AS

The coordinated and sustainable use and management of land, water, vegetation, and other natural resources on a water catchment basis so as to balance resource utilization and conservation (Aust Catchment Management Act, 1999)_

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

WHAT IS IRBM

Process of guarding and coordinating the use of land and other resources in a sustainable manner to obtain products/goods or services

SUSTAINABLE RESOURCE MANAGEMENT

A process of managing resources to achieve/meet management objectives of producing good/product or services without affecting future values and productivity through conservation of physical and environmental quality

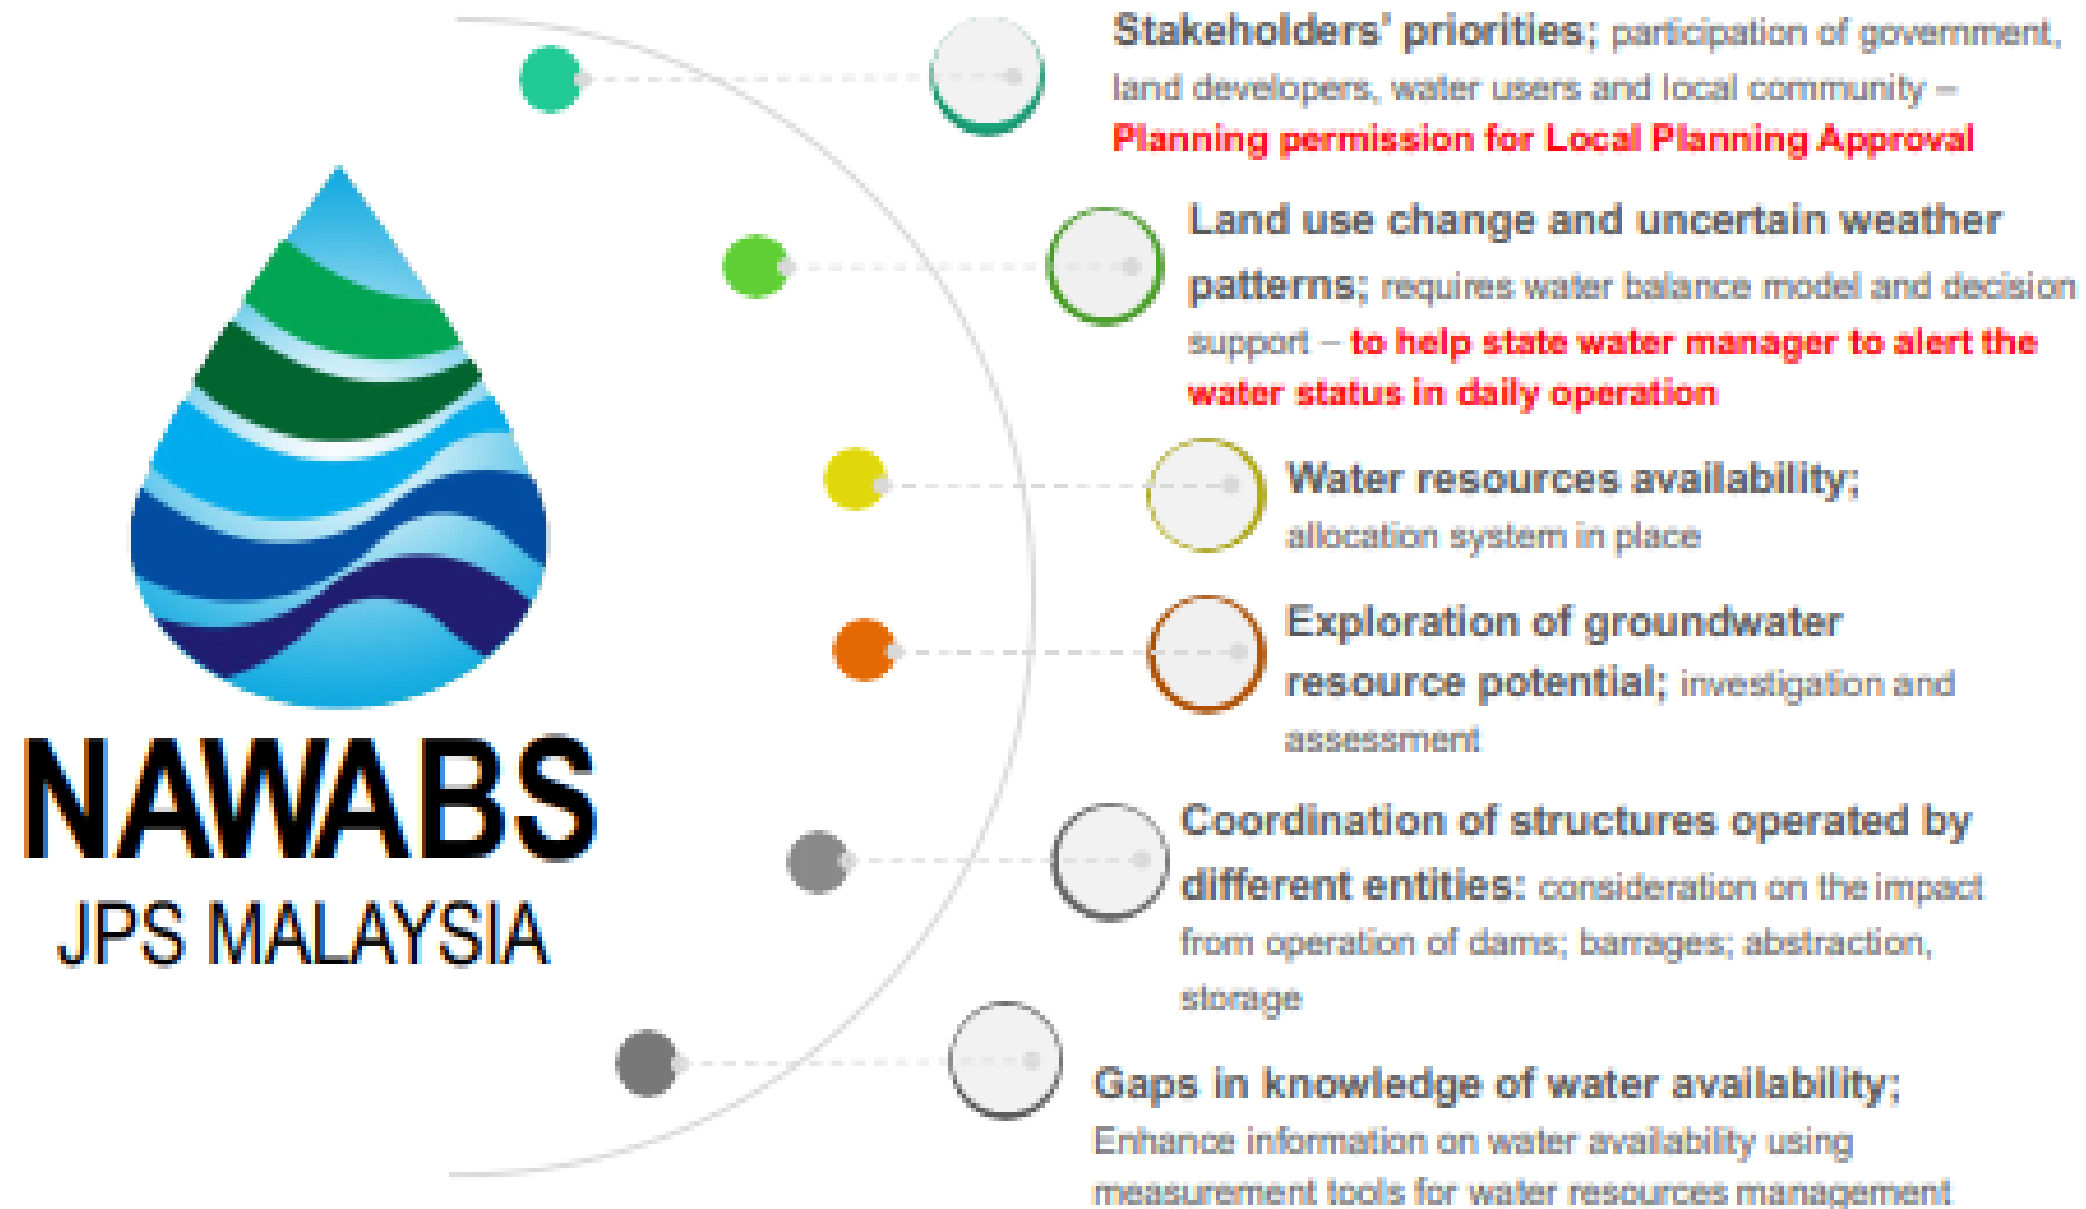

WATER RESOURCES MANAGEMENT TOOLS

Water Quality Management

WETLAND

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

RAMSAR CONVENTION 1971

Areas of marsh, peatland, or water whether natural or artificial, permanent or temporary with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed 6 meters

BIOLOGICAL DEFINITION

Transition zone between terrestrial and aquatic environments

TYPE OF WETLANDS

- Coastal
- Inland
- Tundra
- Bogs and Fens
- Prairie
- Swamps
- Lakes and Ponds
- Rivers and Streams

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

THE VALUE OF WETLANDS

- in the past, wetlands were mostly considered to be wasteland
- as people were settled, swamps and marshes were obstructed along the way.
- many were drained to be replaced by farmland, railroads, and road construction.
- in recent decades, many people have come to recognize the value of wetlands

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

RAMSAR SITES IN MALAYSIA

1. Sungai Pulai, Johor
2. Tanjung Piai, Johor
3. Pulau Kukup, Johor
4. Tasik Bera, Pahang
5. Kuching Wetlands National Park, Sarawak
6. Lower Kinabatangan-Segama Wetlands, Sabah
7. Kota Kinabalu Wetlands, Sabah

HOW WETLANDS WORK

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

NATURAL FUNCTIONS OF WETLAND

CLIMATE EFFECTS

- Carbon fixation and CO₂ balance (photosynthesis)
- rainfall & humidity effects (evaporation & evotransportation)

BIODIVERSITY FUNCTION

- ecosystem diversity
- the link between terrestrial and aquatic ecosystem
- high species and population diversity
- highly diverse microbiological activity

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

TREATMENT PROCESS IN WETLAND SYSTEM

- Biodegradable organic matter removal
- solids removal
- Nitrogen removal
- Phosphorus removal
- Heavy metal removal

Water Quality — Management

LAKES & RESERVOIRS

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

DEFINITION

A physical feature that is a considerable inland body of water, not part of the ocean, that is larger and deeper than a pond, and may or may not be moving slowly, and is localized to the bottom of basin (another type of landform or terrain feature) and is fed by a river

CHARACTERISTICS:

- Area of natural origin
- deeper waters are much colder than surface waters
- waves are common during storms

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

LAKES IN MALAYSIA

- Malaysia is not a lakeland country (no glacial & volcanic activity)
- natural lakes develop through many processes, but the main prerequisite for their existence is their ability of a land cavity to collect and retain water.
- Short lived phenomena - evaporate, drain and water level fluctuates for both geological and climatic reasons.
- Follow a natural path whereby with time they silt up, colonized by plants, and eventually dry up (eutrophication)

NATURAL LAKES IN MALAYSIA

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

TASIK BERA

- 6150 Hectars

TASIK CHINI

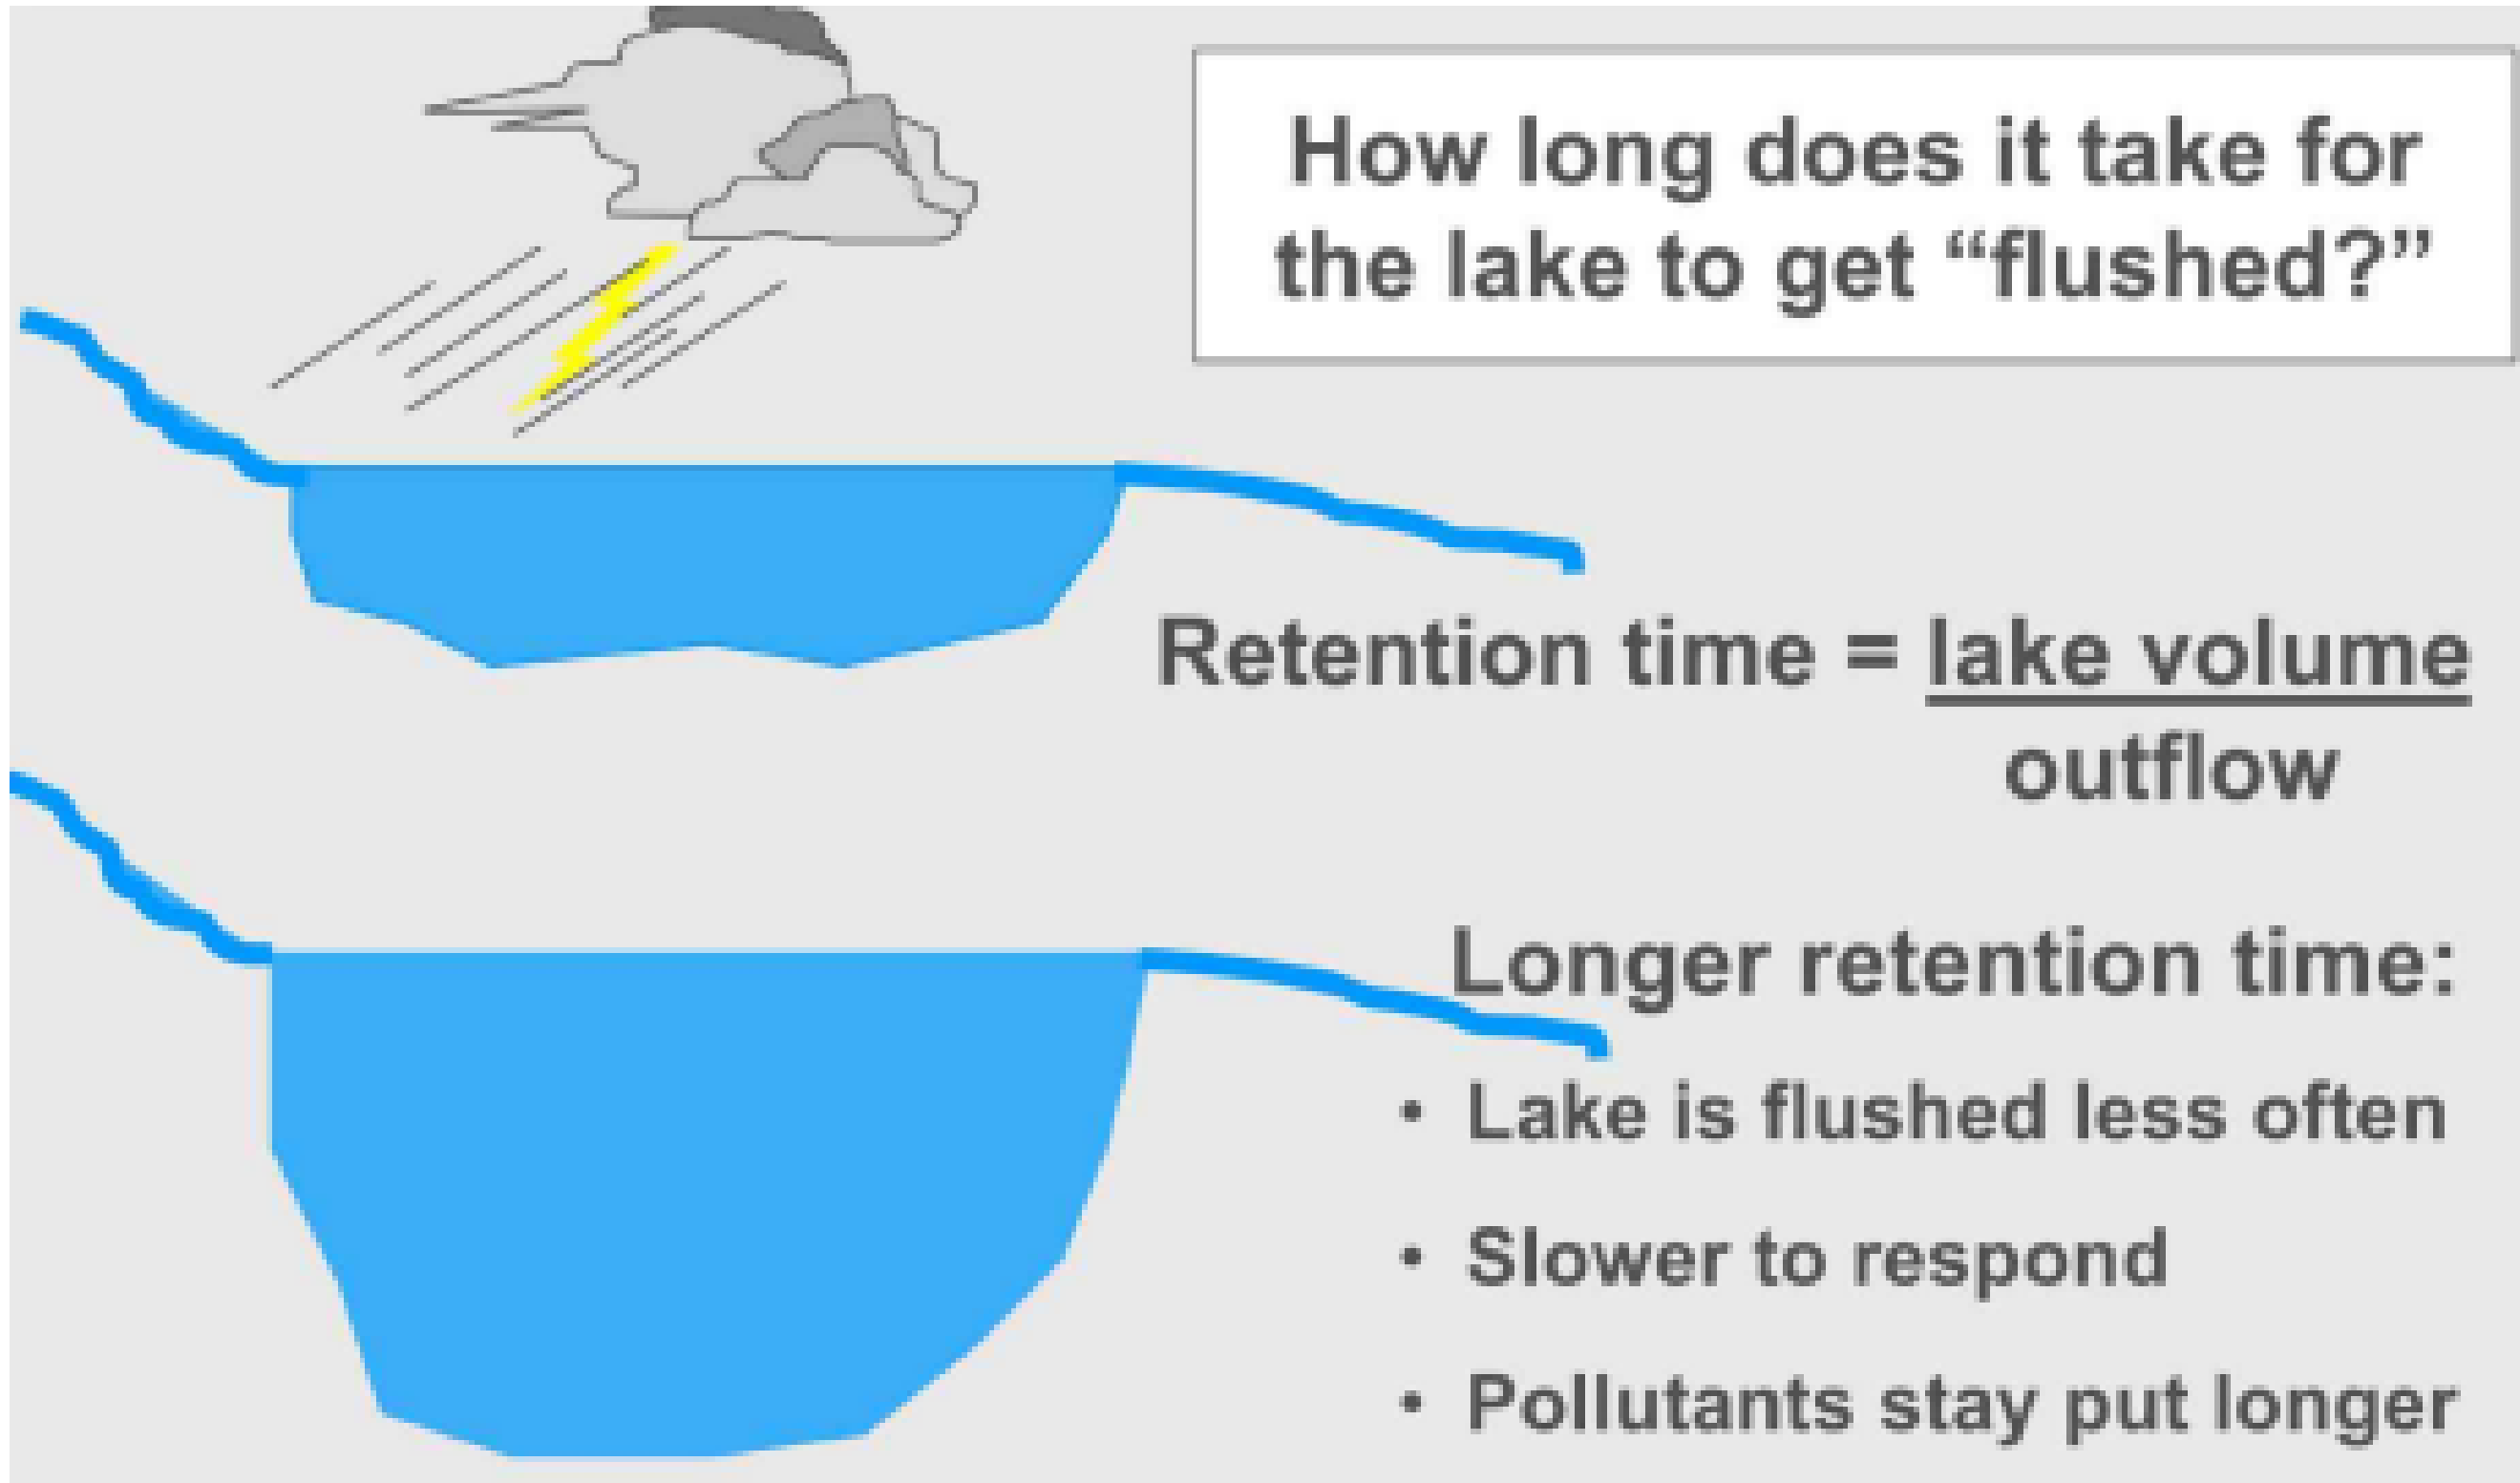

- <1000 Hectars

WHAT IS RETENTION TIME

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

The diagram illustrates two lakes. The top lake is smaller and shallower, with a cloud raining into it. The bottom lake is larger and deeper. To the right of the lakes, a text box asks "How long does it take for the lake to get 'flushed?'" and provides the formula: $\text{Retention time} = \frac{\text{lake volume}}{\text{outflow}}$. Below this, it lists characteristics of a longer retention time: "Longer retention time: Lake is flushed less often, Slower to respond, Pollutants stay put longer".

How long does it take for the lake to get "flushed?"

Retention time = $\frac{\text{lake volume}}{\text{outflow}}$

Longer retention time:

- Lake is flushed less often
- Slower to respond
- Pollutants stay put longer

LAKE & RESERVOIR

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

Lake

Reservoir

LAKE

- open bodies of slow-moving water not in contact with the ocean

long	Period of time the water remains	short
slight	Variation in level	large
Surface	Outflow	hypolimnic
vertical	Gradients	vertical and horizontal
hardly	Management of quality	comprehensive

RESERVOIR

- Usually created for multiple uses and so result in multiple conflict

MAJOR LAKE TYPES

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

GLACIAL

TECTONIC

VOLCANIC

LANDSLIDE

OXBOW

RESERVOIR

LAKE ZONES

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

Figure 6-14b Environment, 5/e
© 2006 John Wiley & Sons

LITTORAL ZONE

- Highly productive
- high species richness

LIMNETIC ZONE

- Photosynthetically productive
- large fish

PROFUNDAL ZONE

- Not always present
- anaerobic, dominated by decomposers

LAKE PRODUCTIVITY

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

PRODUCTION

- Closely related to the size of the watershed
- most productive lakes generally have a high ratio of watershed area to lake surface area
- lakes often classified on productivity (trophic state): Oligotrophic vs eutrophic

EUTROPHICATION

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

LAKE SUCCESSION

- As soon as a lake is formed it begins to "die"
- Lake succession = term used to describe changes in plant and animal populations

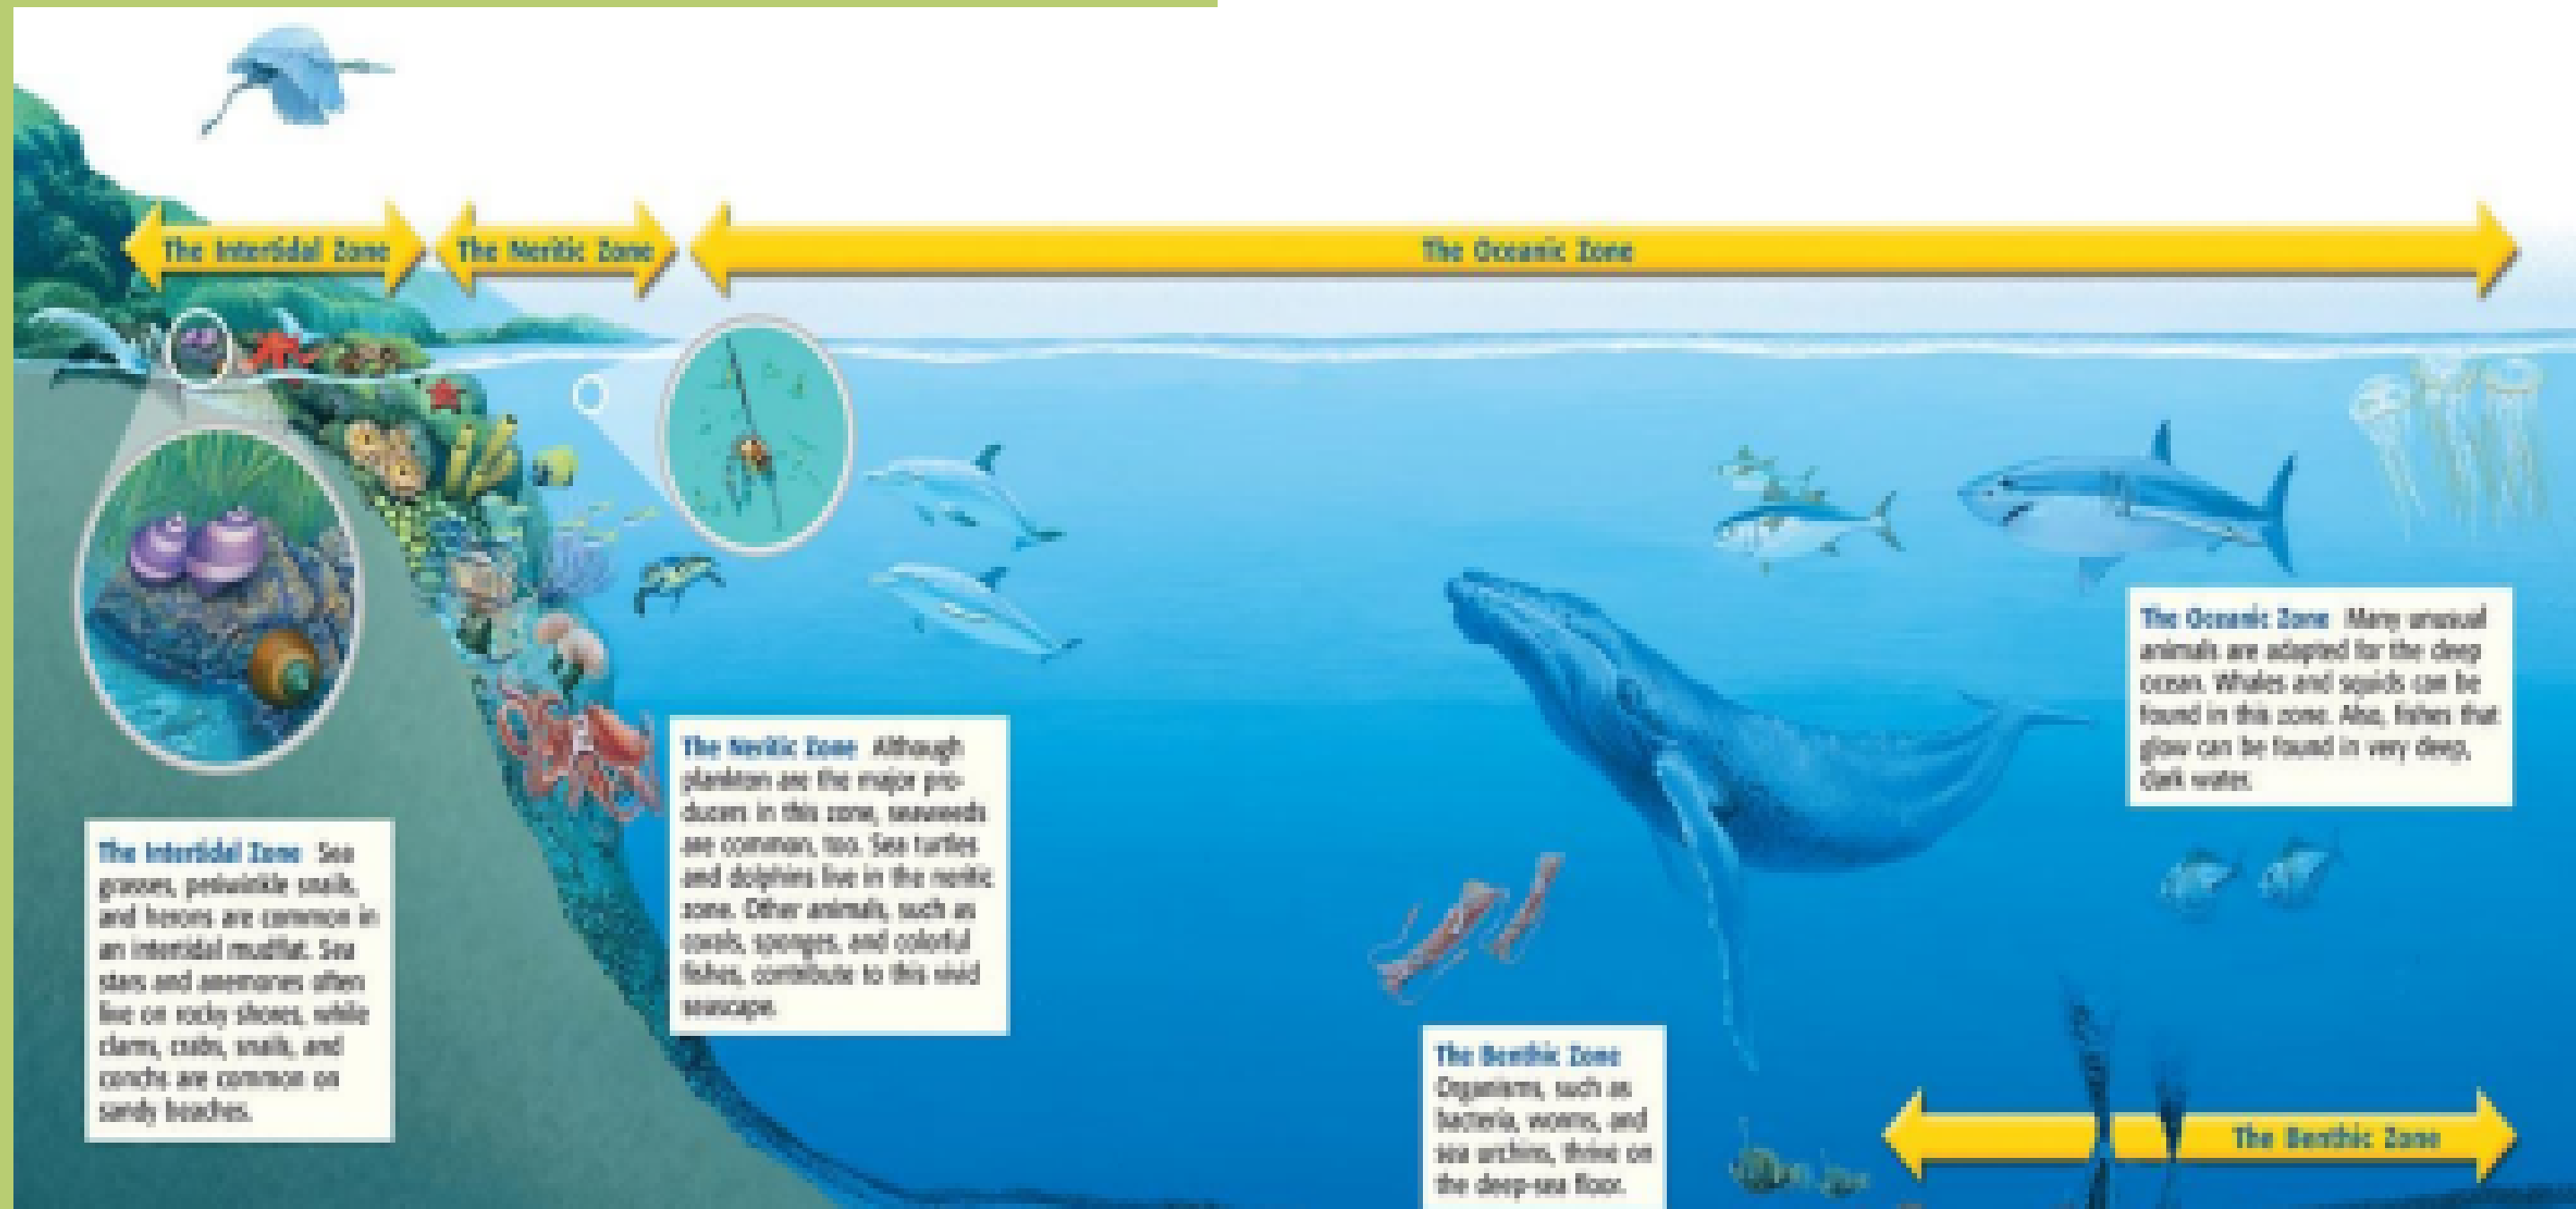

MARINE ZONES

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

- Life in a marine ecosystem depends on water temperature, water depth, and the amount of sunlight the area receives.
