PIPELINE, RAIL, TRUCK OR TANKER SHIP?

For human death and property destruction:

truck worse than train worse than pipeline worse than tanker

(Oilprice.com)

For amount of oil spilled:

truck worse than pipeline worse than rail worse than tanker (<u>Congressional Research Service</u>)

For environmental impact (dominated by impact to aquatic habitat):

tanker worse than pipeline worse than truck worse than rail

! So it depends upon what your definition is for *worse*.

copyright owner.

What is Pipeline?

- Function to transports hydrocarbon, chemicals, injection water & gas from one point to another point
- Infield flowlines: To transport hydrocarbon/water/gas between components of a field (e.g. manifold and riser base)
- Export pipelines: To transport hydrocarbon to the other platforms or onshore
- Trunk pipeline: To transport oil and petroleum products over long distances

The Pipe Carbon-manganese Steel Pipe

© 2021 UNIVERSITI TEKNOLOGI PETRONAS All rights reserved. No part of this document may be reproduced, stored in a retrieval system or transmitted in any form or by any means (electronic, mechanical, photocopying, recording or otherwise) without the permission of the copyright owner.

Carbon-manganese steel pipe is widely used for oil and gas pipelines due to its high strength.

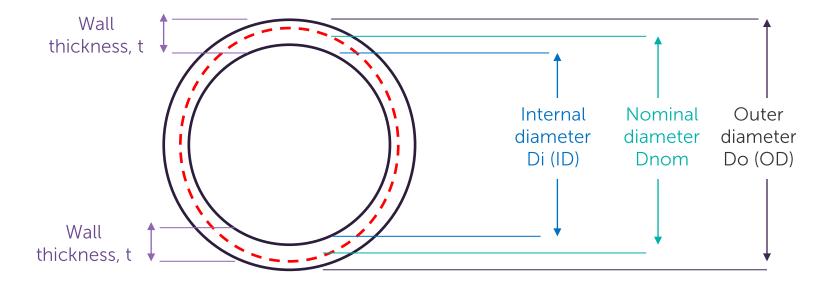

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

• Generally, the pipes are manufactured in approximately 40-foot (12 m) lengths.

• The pipe diameter must be large enough to transport the maximum volume of hydrocarbon.

• The pipes are usually made of high-quality carbon steel that is produced to specific standards e.g. API 5L specifications.

Standard strength grades and yield to tensile rations:

Grade	Minimum Yield Strength		Minimum Tensile Strength		YS/TS
	lb/in ²	MPa	lb/in ²	MPa	ratio
A25	25,000	172	45,000	310	0.556
A	30,000	207	48,000	331	0.625
B	35,000	241	60,000	413	0.583
X42	42,000	289	60,000	413	0.700
X46	46,000	317	63,000	434	0.730
X52	52,000	358	66,000	455	0.788
X56	56,000	386	71,000	489	0.789
X60	60,000	413	75,000	517	0.800
X65	65,000	448	77,000	530	0.844
X70	70,000	482	82,000	565	0.854
X80	80,000	551	90,000	620	0.889

Table 3–1 Standard Strength Grades and Yield to Tensile Ratios

Source: Palmer and King (2004)

Advantages and disadvantages of a carbon steel pipe:

ADVANTAGES	DISADVANTAGES	
High tensile strength	Prone to external corrosion	
High compressive strength	Electrolysis prone	
Range of corrosion protection system	Jointing requires skilled welders	
Wide range of diameters and wall	Internal/external corrosion protection	
thickness	system add to price	
Welded joints give continuity	Coatings and lining can get damaged	
	during installation by third parties	

Different wall thicknesses of wall have their own complications.

	ADVANTAGES	DISADVANTAGES
Thick	Higher strength.	Higher operating costs.
Diameter		
Thin	Reduce material,	Cannot operate at high
Diameter	transportation, loading and	pressures.
	welding costs.	

PIPELINE Construction

The pipeline is made by one of four fabrication methods:

- **1. Seamless method** has no longitudinal weld seam. One solid piece of steel. A *billet* is cut from slab and heated and formed by rollers to produce a length of pipe.
- **2. Electrical resistance welded (ERW) pipe** is formed from plate of steel flattened and pass through a sequence of rolls to form the pipe. The longitudinal seam weld is made by ERW.
- **3. Submerged Arc Welded (SAW)** or sometimes called U-O-E pipe is formed from individual plate of steel by forming a plate into a U, then into a tube (O).
- **4. Spiral Weld** is manufactured by steel strips and welded spirally.

SEAMLESS PIPE

- Seamless tubing is fabricated by drawing a billet of metal through a die.
- No welding.
- Potential problems of variance in wall thickness.

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

Welded Pipe

- Welded tubing is made from sheet stock that has been cut, rolled into a tube, and welded.
- The weld is thicker than the rest of the tube wall, which is extremely consistent in thickness.
- Welded tubing has the risk of being slightly out of round, due to its manufacturing process.
- Without further interior finishing, the weld leaves ridges the length of the tube.
- Welded tubing is 20% weaker than seamless as far as burst strength is concerned.

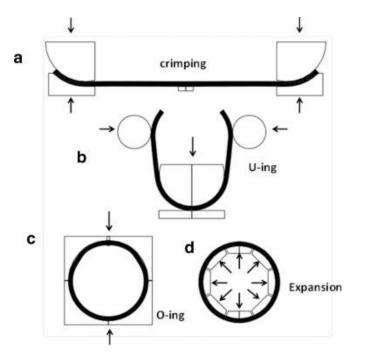

Welded Pipes: ERW, SAW, Spiral

CHOOSE YOUR PIPE

Factors to be considered are:

- <u>Burst strength</u> seamless provides the strongest burst strength!
- <u>Roundness/Consistence of wall thickness</u> welded pipes are more prone to out-of-roundness problem.
- <u>Cost</u> seamless is the most expensive option and welded is the least expensive.
- <u>Least corrosion</u> welded may trigger more corrosion at the welding area due to imperfections.

Co-funded by the Erasmus+ Programme

PIPELINE INSTALLATION

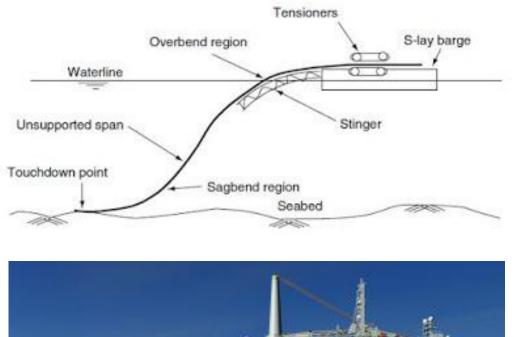

There are four methods to install offshore pipelines:

- 1. S-lay
- 2. J-lay
- 3. Reel barge
- 4. Tow-in methods
 - Surface tow method
 - Off-bottom tow method
 - Mid-depth tow method
 - Bottom tow method

S-Lay Method

The S-lay method is used in a range of water depths from shallow to deep. Requires a laying barge equipped with several welding stations.

As the barge moves forwards, the pipe is eased off the stern, curving downward through the water as it leaves until it reaches the touchdown point *i.e.* 'S' shape!

A stinger is used to support the pipe as it leaves the barge, by reducing the bending stress.

© 2021 UNIVERSITI TEKNOLOGI PETRONAS All rights reserved. No part of this document may be reproduced, stored in a retrieval system or transmitted in any form or by any means (electronic, mechanical, photocopying, recording or otherwise) without the permission of the copyright owner.

Advantages:

- Pipeline with a diameter up to 60" can be installed
- Cost effective for remote locations
- Can install concrete coated pipelines

Disadvantages:

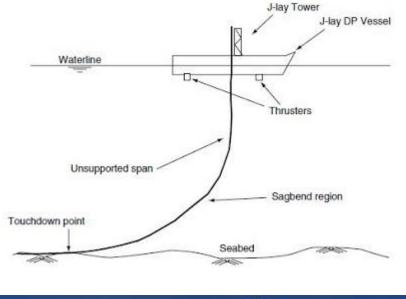

- Suitable for shallow water installation only (about 300 m)
- Slow installation rate
- Large construction team required
- High lay tension applied to barge due to shallow lay angle
- Line pipe to be supplied by other vessels

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

J-LAY METHOD

The J-lay method avoid difficulties of S-laying approach.

Can be used in **deeper** water than the S-lay method.

The barge has a **tall tower** on the stern to weld and slip pre-welded pipe sections.

Its barge drops the pipe down almost vertically until it reaches downtown *i.e.* 'J' shape!

Advantages

- Suitable for deep water installation
- Pipelines with large diameter can be installed
- Can install concrete coated pipelines
- Only option for installing large diameter pipelines in ultra deep water

Disadvantages

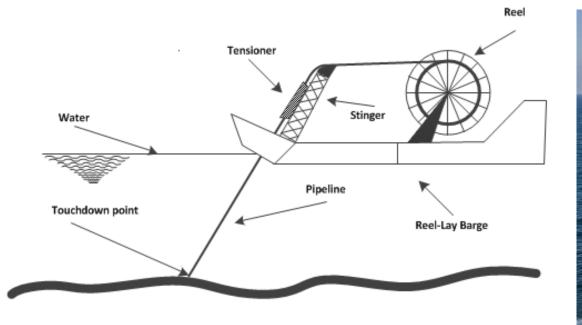

- Slow installation rate as there is not working/welding station only
- Pipe quads need to be supplied by other vessels

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

Reel barge Method

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

Advantages

- Smaller pipe lay barge and construction team
- Faster installation rate as joints pre-welded

Disadvantages

- Pipeline undergoes some cycles of plastic deformation
- All type of coating system can not be used
- Limitation in pipeline diameter
- Pipeline thickness may increases due to the buckling resistance required during reeling
- Require more than one reel, thus reel barge needs to go back to the spool.

TOW-IN-METHODS

For all tow-in methods, the pipe has to have a **uniform low weight** during the tow.

Must have an abrasion-resistant coating that can stand up to being dragged across the seabed.

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

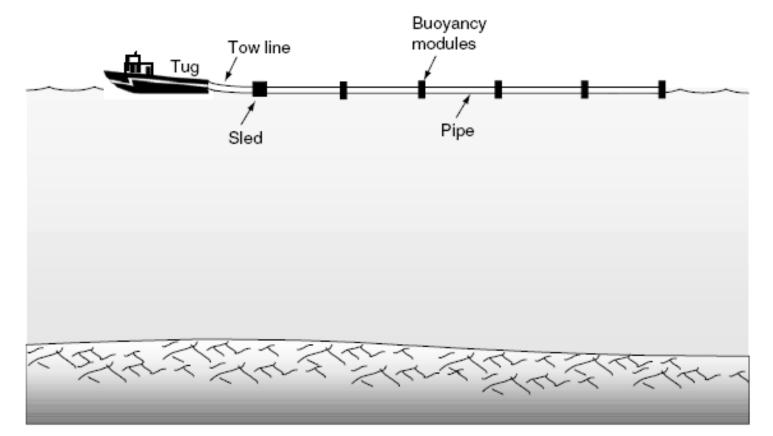

SURFACE TOW METHOD

Surface tow

© 2021 U

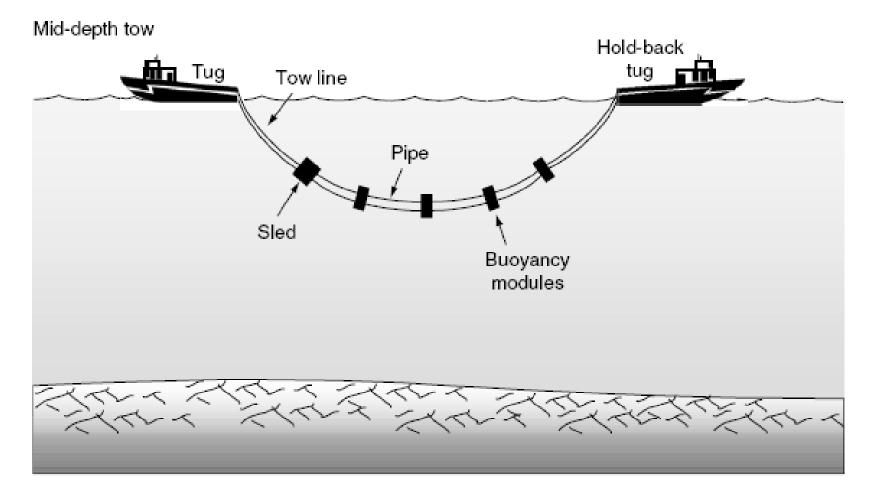

All rights 1 No part of copyright of

Buoyancy are added to the pipeline so that it floats at the surface. Once the pipeline is towed on site by the two towboats, the buoyancy modules are removed or flooded, and the pipeline settles to the sea floor.

MID-DEPTH TOW METHOD

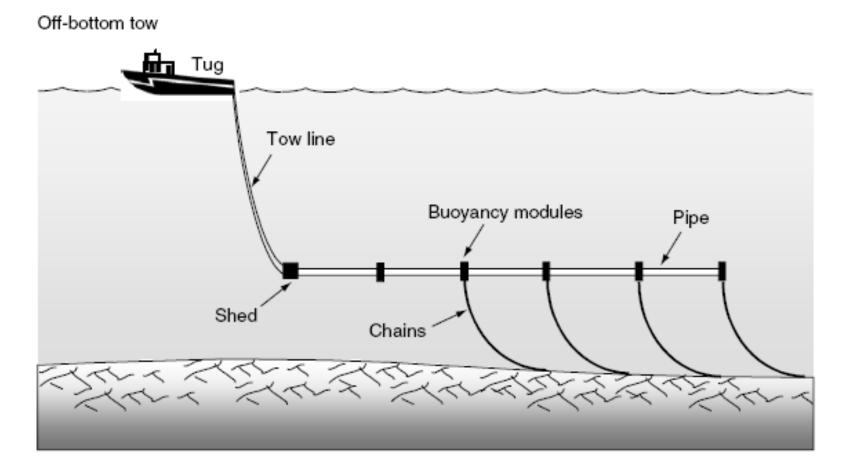

Requires fewer buoyancy modules. The pipeline settles to the bottom on its own when the forward progression ceases.

© 2021 UNIVERSITI TEKN(All rights reserved. No part of this document may be re copyright owner.

OFF-BOTTOM TOW METHOD

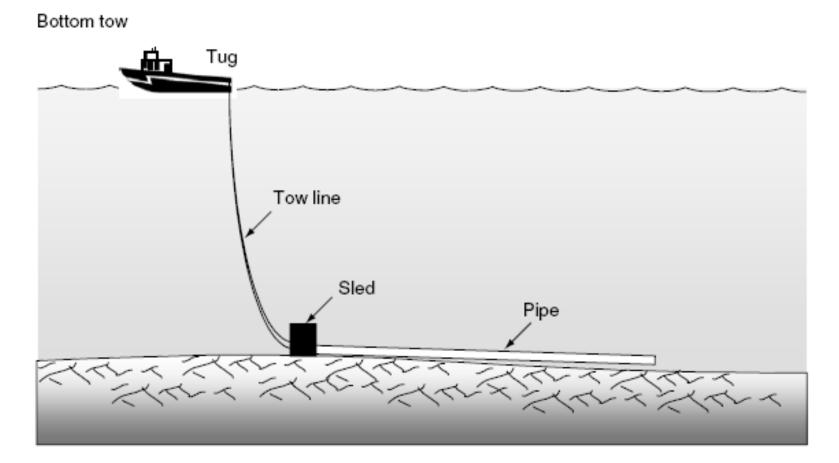

Involves both **buoyancy** modules and added **weight** in the form of chains. Once on location, the buoyancy is removed and pipeline settles to the sea floor.

© 2021 UNIVERSITI TF All rights reserved. No part of this document may copyright owner.

BOTTOM TOW METHOD

The route has to be surveyed carefully. Pipeline is allowed to sink to the bottom and then towed along the sea floor.

© 2021 UNIVERSITI TEKNOLOC All rights reserved. No part of this document may be reprodu copyright owner.

PIPELINE Route Selection

The truth is...

Each pipeline project takes on its own unique challenges based on the location, environmental sensitivity, size of pipe, product to be transported and proposed schedule.

BASIC QUESTIONS TO CONSIDER...

- What is the best route between two points?
 - Straight line
- Why can't have straight line?
 - Seabed obstructions
 - Existing infrastructures
- What to do:
 - Avoid them as much as possible
- What if can't?
 - Bend the pipeline around them
 - Cross existing pipeline perpendicularly

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

Pipelines may need to be **buried** to protect them from near-shore wave forces, ship anchors and commercial fishing activities.

Buried Pipeline

GEOPHYSICAL SURVEY

- Geophysical survey is to obtain:
 - Seafloor terrain
 - Seabed bathymetry
 - Natural seabed features
 - Existing infrastructures
 - Man -made obstructions
 - Shallow subsea profile

- Sub-bottom profiler is used to investigate under seabed soil layers
- Layers and thicknesses are shown by colour coding

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

GEOTECHNICAL SURVEY

- To obtain soil design parameters to:
 - Assess soil downwards resistance (soil as foundation, penetration and etc.)
 - Assess lateral resistance (on-bottom stability, lateral buckling and etc.)
 - Assess soil upwards resistance (upheaval buckling)
- Tests/Survey Types:
 - In situ testing
 - Sampling

SEABED OBSTRUCTIONS

Natural seabed features

- Boulders
- Iceberg groves
- Gas chimneys
- Sensitive seabed
- Seabed slopes

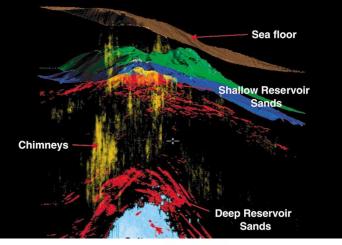

• Existing infrastructures

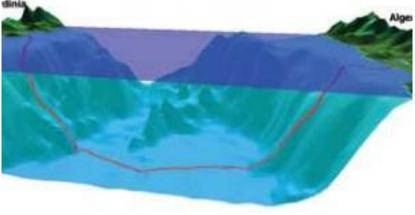

- Pipelines and umbilicals and cables
- Anchoring zones and anchor chains
- Manifolds and wellheads

• Man-made obstructions

- Debris
- Wrecks
- Scaffolds (close to existing platforms)
- Mattresses (close to existing platforms)

#1. CORROSION

What is corrosion?

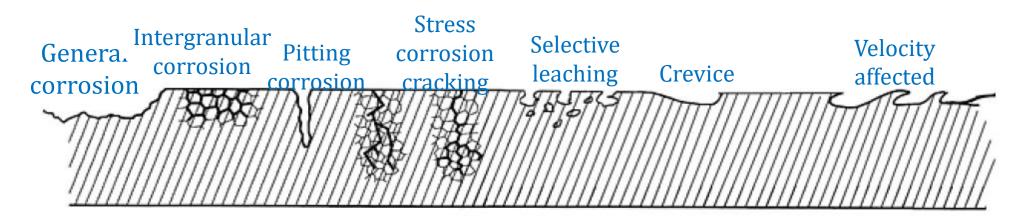

Corrosion is defined as the chemical or electrochemical reaction between a material, usually a metal, and its environment that produces deterioration of the material of the material and its properties.

Corrosions can be observed either at the internal or external side of the pipeline wall.

FORMS OF CORROSION

Different forms of corrosion developed on a particular metal surface (Freeman, 2002)

© 2021 UNIVERSITI TEKNOLOGI PETRONAS All rights reserved. No part of this document may be reproduced, stored in a retrieval system or transmitted in any form or by any means (electronic, mechanical, photocopying, recording or otherwise) without the permission of the copyright owner.

General (Uniform) corrosionDefined as corrosion with a length and width greater than three to uncorroded wall thickness.Uniform thinning of metal surface that proceeds without appreci- localized attack.Corrosion rate is assumed constant over the period of time.Localized (Pitting) corrosionDefined as corrosion with a length and width less than or equal to times the uncorroded wall thickness.A form of extremely localized corrosion that leads to the creation holes in the metal.Thickness is reduced locally.Crevice corrosionOccurs in spaces to which the access of the working fluid from the environment is limited, e.g. slots and in gaps at metal-to-metal and to-nonmetal interfaces, especially at critical joining surfaces.Galvanic corrosionOccurs when two dissimilar conducting materials (metallic or no are in electrical contact.One metal corrodes preferentially to another when both metals a electrical contact and immersed in an electrolyte.Intergranular corrosion

Corrosion	Characteristics		
Stress corrosion cracking (SCC)	 An unexpected sudden failure of normally ductile metals subjected to a tensile stress in a corrosive environment, especially at elevated temperature in the case of metals. 		
Selective leaching	 Removal of one element or phase from a solid alloy which results in an altered matrix usually consisting of a porous mass. Also known as dealloying, and when referring to the noble metals, it is also called parting. 		
Velocity affected corrosion	 Depends on the relative velocity between the water and the metal surface. Water corrosivity can be dramatically increased by dissolved gases, acids, salts, strong bases, entrained abrasives, high temperature, fluctuating pressure, cavitation, or impingement. 		
Microbially-induced corrosion (MIC)	 Caused or promoted by microorganisms or living organisms, e.g. sulphate-reduced bacteria (SRB), algae or fungi. Often associated with the presence of tubercles or slimy organic substances.

CORROSION MITIGATION

There are two kinds of corrosion mitigation strategies:

1. INTERNAL CORROSION

- Corrosion inhibitor is the chemical injection used to control corrosion development inside the pipeline.
- It is released into the pipeline at certain time intervals.

2. EXTERNAL CORROSION

 Sacrificial anode is used to control corrosion development outside the pipeline.

Corrosion inhibitors

Sacrificial Anodes

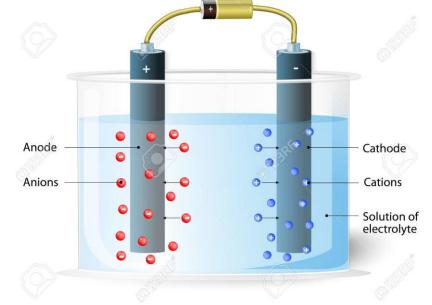

Electrolysis is chemical decomposition produced by passing an electric current through a liquid or solution containing ions.

Electrolysis is commercially important as a stage in the separation of elements from naturally occurring sources such as ores using an **electrolytic** cell.

- *Pigging* in the maintenance of pipelines refers to the practice of using pipeline inspection gauges or *pigs* to perform various operations without stopping the flow of the product in the pipeline.
- The name pig was originally applied to scrapers which were devices driven through the pipeline by the flowing fluid trailing spring-loaded rakes to scrape wax off the internal walls. The rakes made a characteristic loud squealing noise.

INTELLIGENT PIGGING

An intelligent pigging (IP) is an important tool used to:

- remove deposits which could obstruct or retard flow through a pipeline.
- report conditions of the pipeline wall.
- control corrosion development.

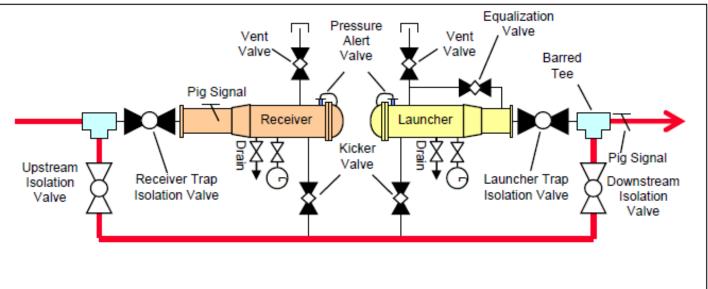

© 2021 UNIVERSITI TEKNOLOGI PETRONAS All rights reserved.

PIG TRAP SYSTEM

Pipeline pigs are inserted into the pig launcher and travel throughout the length of a pipeline driven by a product flow, and collected at the pig receiver.

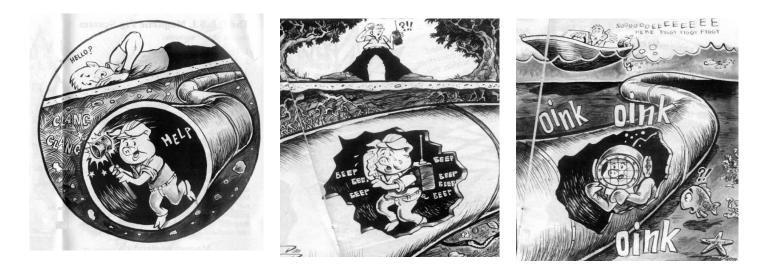

© 2021 UNIVERSITI TEKNOLOGI PETRONAS All rights reserved. No part of this document may be reproduced, stored in a retrieval system or transmitted in any form or by copyright owner.

LOST PIG IN PIPELINE

 A pig sometimes experiences difficult time to find its way 'home' and consequently lost in the pipelines.

 One of the reported incidents involving pig lost can be referred to Lino et al. (2006). The incident happened when a *mandrill pig* was unable to be detected at the pig receiver.

"In Search of the Lost Pig"

Pipeline & Gas Journal, August 1, 2006

Lino, Antonio Carlos Ferreira; Filho, Durval Florencio; Pereira, Fernando Borja; da Silva, Jose Silverio; Amado, Ulisses Dias

"A mandril pig was lost and then found in an operating oil pipeline in Brazil's Amazon forest in a project that involved six field operations involving 48 days of work over a nine-month period.

The adventure began when a 14-inch mandril pig was launched from the Urucu Unit to run through the ORSOL I oil pipeline in the Amazon and did not arrive at the Coari Terminal, located 280 km from the launch site. The crew at Coari was surprised, to say the least, when the pig did not turn up on time. In cleaning operations, low-density foam pigs normally were used in ORSOL I. This mandril pig was used for the first time in ORSOL I to improve the cleaning process. In the past, other types of mandril pigs were used without problems.

Once the pig was determined to be lost, considering the possibility of a lack of sealing, the crew decided to launch a low-density foam pig with an abrasive coating. When the original mandril pig and the foam pig didn't arrive, the crew sent two more foam pigs without success. Pieces of the foam pigs were recovered in the receiver but most pieces remained lost somewhere inside the pipeline, along with the mandril pig."

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

- The search for the lost pig by Lino et al. (2006) reached to an end when the pig was located 20 km farther away from the launcher.
- The pig that was broken into parts was then investigated to identify the causes of failures.
- Based on the examination and analysis of all pig components, the pig could be dismantled:
 - \checkmark due to a valve misalignment,
 - \checkmark caused by a dent in the sector of pipeline between the launcher and valve station,

Dent in Pipe

✓ as a result of inadequate construction whereby, the pig was unable to support the operational loads, or

✓ from an operational failure during the launching.

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

When a **pig got stuck in a pipeline**, the pipeline operations are exposed to production dangers like:

• Wax accumulation — in regular pigging routines, wax accumulation is controllable. However, disruption to a cleaning routine could create a significant wax accumulation.

•Water accumulation — in addition to wax removal, pigging removes water. A disruption to the cleaning routine could create a significant accumulation of water which could, in turn, create a pipeline blockage.

•Pipeline erosion — an increase in flow velocity in the specific location of the lost pig could amplify the erosion factor and cause further damage to the pipeline.

#2. BUCKLING

Types of global buckling:

- Upheaval buckling
- Lateral buckling

Some key factors are:

- Pipeline dimensions and mechanical properties
- Content pressure & temperature
- Soil properties
- Seabed features and vertical and lateral imperfections
- Boundary conditions
- Fishing gear interaction
- Residual lay tension

© 2021 UNIVERSITI TEKNOLOGI PETRONAS All rights reserved.

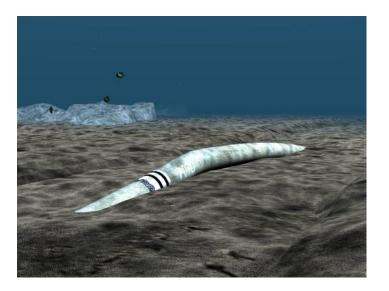

• Key factor is effective axial force.

Lateral Buckling

 Is a type of global buckling where the pipeline buckles sideways from the location where it has been laid. In this case, due to the pressure and temperature in the pipeline, effective compressive axial force increases to the level above the resistance of the soil frictional and embedment resistance.

<u>Plan view</u>

Upheaval Buckling

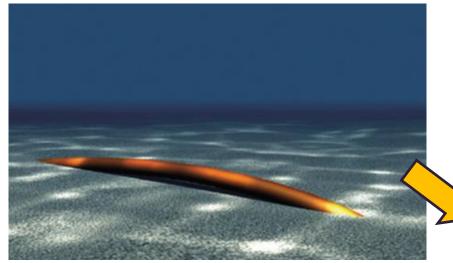

• Is a type of global buckling where the pipeline buckles upward from the location where it has been laid. In this case, due to the pressure and temperature in the pipeline, effective compressive axial force increases to the level above the resistance of the soil and rockdump cover.

ROCK DUMPING ON UPHEAVAL BUCKLING

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

<u>Wax</u> – Paraffin precipitation and deposition in crude oil transport flowlines and pipelines is called wax.

<u>Hydrate</u> – Gas hydrates are ice-like crystals that forma around water molecules when the water us subjected to low temperatures and high pressure like those found in deepsea drilling.

Scale – Scale is the formation of inorganic, sparingly soluble salts from aqueous brines during oil and gas production. Scale forms and deposits under supersaturated conditions, wherever the mixing of the incompatible types of water; formation water from the bottom hole and the injected seawater, takes place.

Non-Metallic (Composite) Pipe

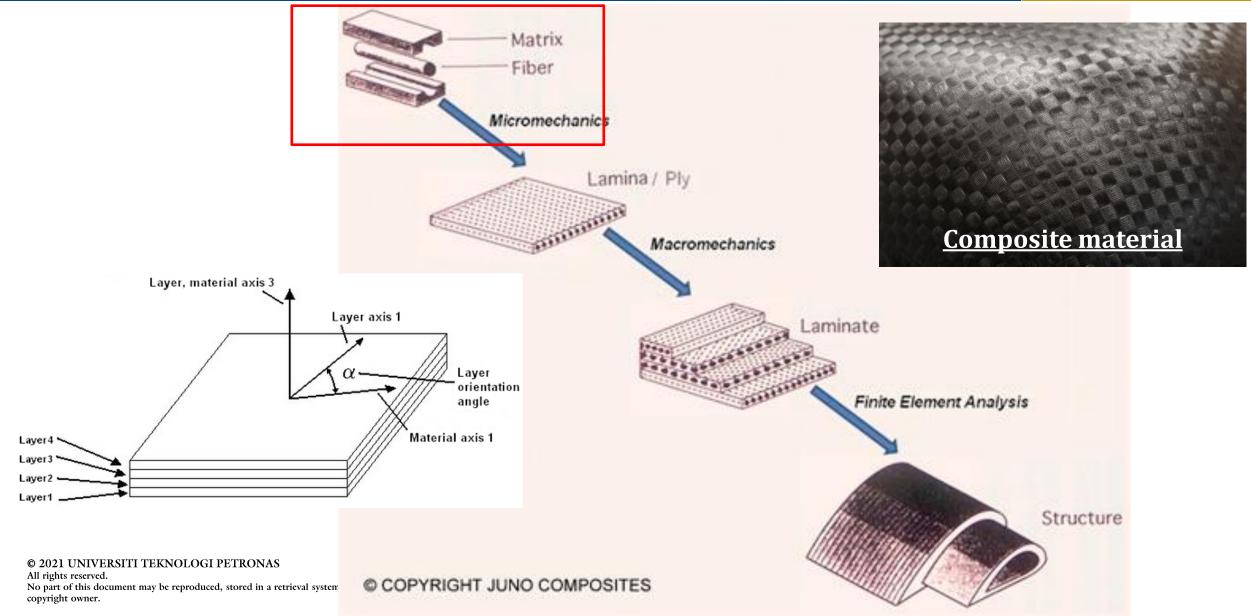

Carbon Steel Pipe

Material properties

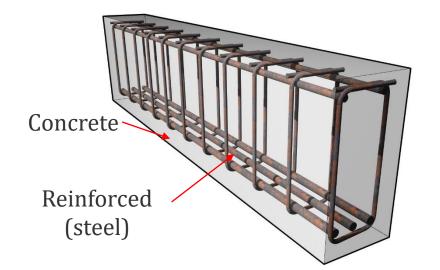

WHAT IS COMPOSITE?

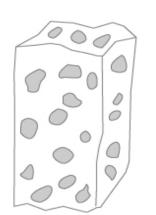

Origin...

Modified to...

- A. Particle Reinforced Composites
- B. Fiber Reinforced Composites
 - Short Fiber Reinforced
 - Long Fiber Reinforced

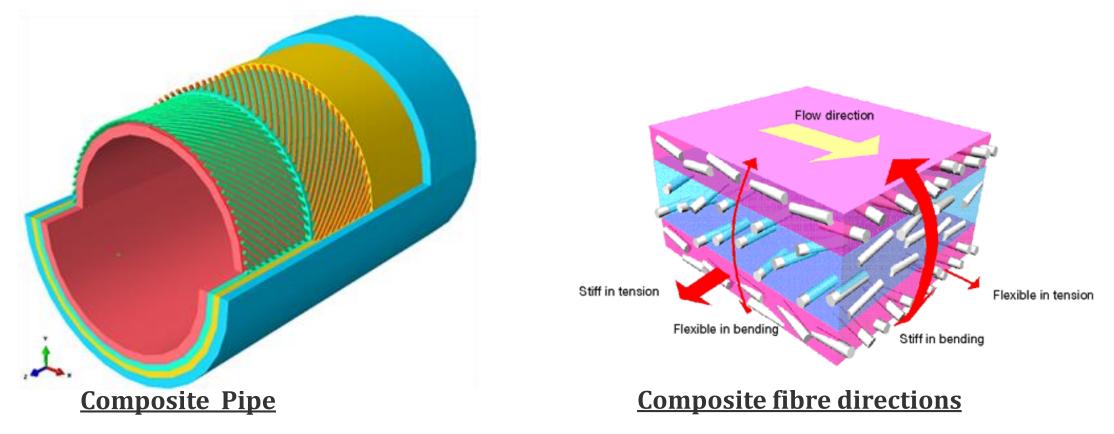

Particle reinforced composite Fiber reinforced composite

Composite materials are made of multiple layers of different materials.

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

All rights reserved.

Carcass:

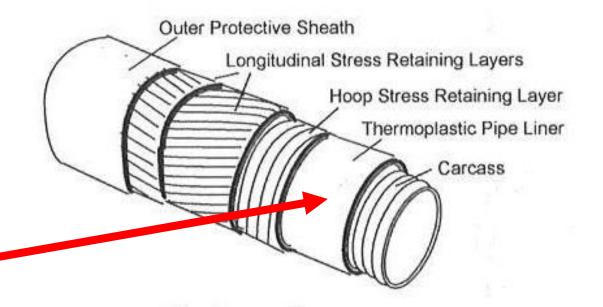

- Function to prevent collapse of the thermoplastic pipe liner as a result of gas expansion or hydrostatic pressure.
- Helically wound interlocking metal strip that is permeable to the transported fluid.
- Not gas/fluid tight, liner will swells and seals the carcass when exposed to hydrocarbon.

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

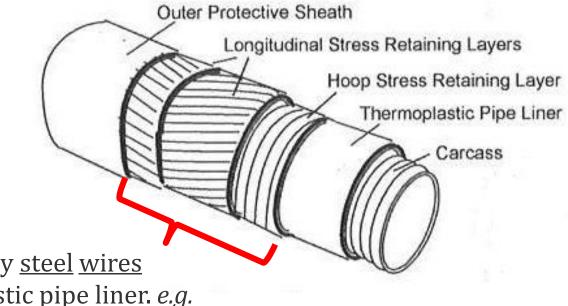

Liner:

- Function to contain the hydrocarbon fluid.
- Fabricated from high-density polyethelene, nylon and fluorinated polymers.
- Choice of liners depends on the operating temperature:

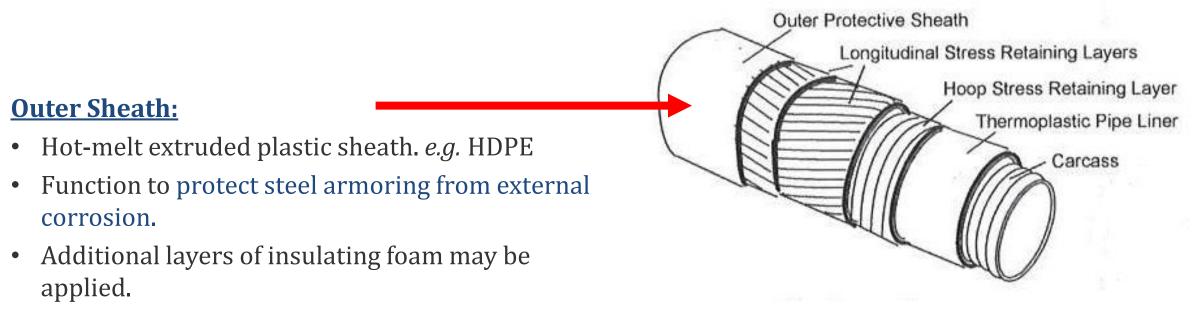

Pressure Containment layers:

- **Internal pressure:** Contained by <u>steel wires</u> wrapped around the thermoplastic pipe liner. *e.g.* hoop stress retaining layer.
- External pressure: Hoop stress retaining layer is overlaid with two layers of <u>armoring</u>. <u>Circular</u> or <u>flat</u> <u>steel</u> strips layers. <u>Opposing</u> helical wounding to balance the extension forces.

• Cathodic protection is also provided. *e.g.* sacrificial anode

Advantages and disavantages of a composite pipe:

ADVANTAGES	DISADVANTAGES
Stronger than steel pipe	Slow to be recognized due to lack of
	standards and testing procedures
Flexible, reducing stress	
	Lack of material production.
Cheaper compared to steel	

'SMART PIPE'

Industries' **wish list** of the next Pipe Technology:

- \circ Real-time monitoring system
- \circ Real-time health condition of the pipe
- Hazards free pipe
- Optimized assessment approach (e.g. probabilistic approach etc.)
- Zero maintenance
- $\,\circ\,$ Zero inspection
- Self-healing pipe *etc*.

SmartPipe - SINTEF

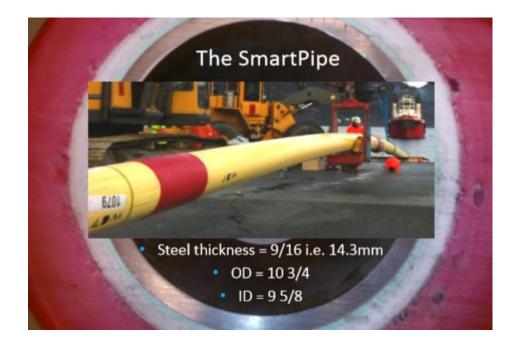

© 2021 UNIVERSITI TEKNOLOGI PETRONAS

Test was conducted on a <u>200 meter pipe</u>, which was a part of a 100 km pipeline.

The <u>sensors</u> are placed as a belt, at 24 meters interval.

Aim to see whether the <u>electronics and communication system will work underwater for a long period of time.</u>

HOW SMART?

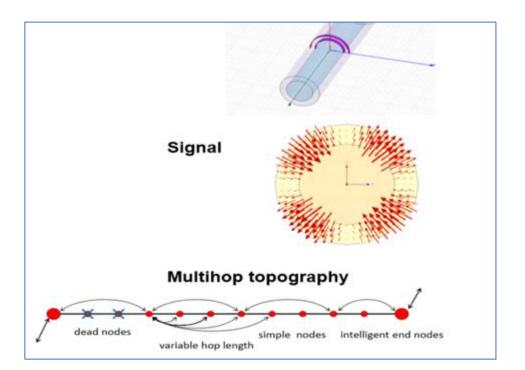

Intention:

- To gather real time information and constructing a database from the collected information to assist in future decision making, to respond to problems at early stages.
- To maintain the condition of a pipeline in an entirely different way.

Information collected:

Design, fabrication, installation, and operation of pipeline.

Temperature Pressure Flow composition Vibration Tension Movement Pipeline wall thickness Corrosion Fatigue

All rights reserved.

Challenges:

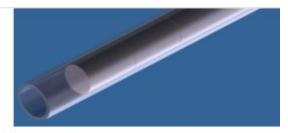

To devise a feasible concept for powering up the sensors and the communication system between the sensors and the operator.

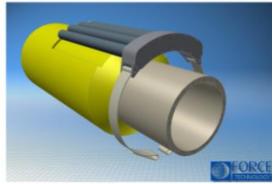

Power supply cables are not feasible especially for long distance pipelines due to cost of material.

The SINTEF SmartPipe developed was equipped with <u>locally produced power</u> <u>(thermoelectric generator) and lithium</u> <u>batteries</u>.

Battery packing

- Four cells in series inserted in steel tubes
 - 600 mm length
 - Space available for charge balancing electronics
 - Hermetically sealed to prevent water intrusion
- Ten 14.4 V battery packs encased in exterior bracelet
 - 40 cells in total (120% capacity)
 - Close contact to cold sea water beneficial for battery lifetime
- Exterior bracelet can be partially embedded in PP-insulation.

WHAT IS NEXT?

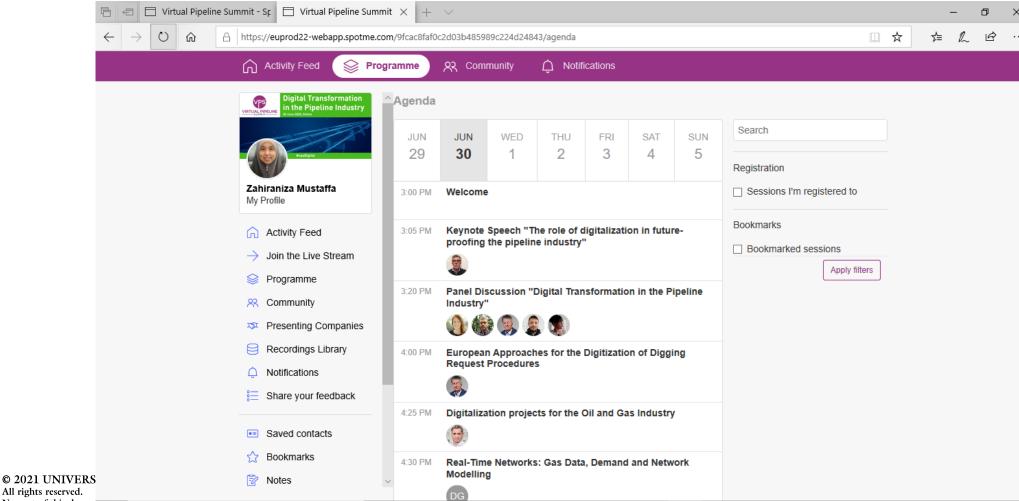

'DIGITAL TRANSFORMATION IN THE PIPELINE INDUSTRY'
